22            **ABSTRACT**

23            Combination of pesticides; acetamiprid, flutolanil and etofenprox are  
24            usually used for tomato fruits for protecting them against pest infection.  
25            Generally, pesticides, residues could be one of the health hazard sources.  
26            Two specific simple sensitive chromatographic methods are developed for  
27            simultaneous estimation of the concerning pesticides' residues using simple  
28            economic steps of field sample preparation. The first method is HP- TLC  
29            method. Hexane: methanol: acetone: glacial acetic acid (8: 2: 0.5: 0.1, by  
30            volume) is proposed as a developing system. The second one is RP- HPLC.  
31            Acetonitrile: water (75: 25, v/v) is proposed as a mobile phase. The  
32            recommended methods are completely validated regarding ICH guidelines.  
33            Their means percentages and standard deviations of accuracy range  
34             $100.32 \pm 0.89$ -  $99.27 \pm 0.9$ . The methods' repeatability and intermediate  
35            precision relative standard deviation percentages range 0.395 & 0.894.  
36            They are successfully applied for estimating the pesticides in pure and  
37            commercial forms and field samples.

38            **Keywords:**

39            Acetamiprid; flutolanil; etofenprox; HP-TLC; RP- HPLC; validation.

42

43

44 **1. Introduction**

45 Many plants' pests and diseases affect food crops. So farmers use the crop  
46 specific pesticides to produce abundant high-quality crops (Knowles,  
47 2008), (Garau, Angioni, Aguilera Del Real, Russo, & Cabras, 2002).

48 Tomato fruits have a high anti-oxidant capacity which reduces the risk of  
49 cardiovascular and cancer diseases (Raiola, Rigano, Calafiore, Frusciante,  
50 Barone, 2014), (Bhuvaneswari & Nagini, 2005) and contain a variety of  
51 vitamins and minerals. Fresh tomato fruits could be a potential source of  
52 harmful and toxic pesticide residues (Zork & Maja, 2009). At Egypt, Al-  
53 Fayoum governorate, location of the study, tomato fruits are sprayed with  
54 three pesticides acetamiprid (ACP), flutolanil (FLL) and etofenprox  
55 (ETFP), concurrently, to control attack of insects and fungal growth  
56 (Approved Recommendations for the Control of Agricultural Pests,  
57 Agricultural Pesticide Committee, Egypt, 2015).

58 Acetamiprid (ACP) is N-[(6-chloropyridin-3-yl) methyl]-N'-cyano-N-  
59 methylethanimidamide and has PubChem CID 213021, MF:  
60 C<sub>10</sub>H<sub>11</sub>ClN<sub>4</sub> and MW: 222.676g/mol. Flutolanil (FLL) is N-(3-propan-2-  
61 yloxyphenyl)-2-(trifluoromethyl) benzamide and has PubChem CID 47898,  
62 MF: C<sub>17</sub>H<sub>16</sub>F<sub>3</sub>NO<sub>2</sub> and MW: 323.315g/mol. Etofenprox (ETFP) is 1-  
63 ethoxy-4-[2-methyl-1-[(3-phenoxyphenyl) methoxy] propan-2-yl] benzene  
64 and has PubChem CID: 71245, MF: C<sub>25</sub>H<sub>28</sub>O<sub>3</sub> and MW: 376.496g/mol.  
65 The chemical structures of the compounds are figured out in **Figure S1**.  
66 They are commonly freely soluble in acetonitrile and methanol (Turner,  
67 2017).

68 The literature survey shows some published methods which determine  
69 them individually; spectrophotometric methods for determination of ACP  
70 and FLL residues (Valéria, Sanja, Nataša & Zsigmond, 2012), (Qin, Shi,  
71 Gen-di, Hongboand, & Xiao, 2011), (Gallart, Armenta & Guardia, 2016),  
72 HPLC methods for determination of ACP and FLL residues residue (Lazić,  
73 Šunjka, Grahovac, Guzsavány, Bagi, & Budakov, 2012), (Martínez, Gil  
74 Garcí'a, Martinez, & Lopez, 2002), (Kikuchi, Sakai, Nemoto, & Akiyama,  
75 2018) and HPLC methods for determination of ETFP residue on vegetables  
76 (Jia, Bi, Wang, Qiu, Zhou, & Zhou, 2006), (Sung, Abd El-Aty, Young,  
77 Myeong, Mi, & Han, 2014), (Deuk, Hyeok, & Kwon, 2011). In spite of  
78 (Hegazy, Abdelfatah, Mahmoud & Elsayed, 2018) has published an HPLC  
79 method for determining a limited number of pesticides, they determine  
80 pesticides mixture which is different from the concerning mixture. Also,  
81 the method is applied to another plant species.

82 The trend to analyze a narrow range of pesticides belong certain plant  
83 product via specific method has been noticed last years (Abdelfatah,  
84 Hegazy, Mahmoud & Elsayed, 2018), (Tiwari, & Asthana, 2012), (Baig,  
85 Akhtera, Ashfaq and Asi, 2009). A GC-Mass method is found for the  
86 estimation of 186 pesticides including the concerned pesticides (Zhao,  
87 2014). The work aims to estimate the residues of tomatoes crop specific  
88 pesticides on the fruits before processing and serving stage.

89

## 90 **2. Materials and methods**

### 91 ***2.1 Instruments***

#### 92 ***2.1.1 HP-TLC method***

93 CAMAG TLC scanner operated by winCATS software, HP-TLC 20 x 20  
94 cm aluminum plates coated with 0.25 mm silica gel 60 F<sub>254</sub> (Merck,  
95 Germany), rotary flash evaporator (Shanghai Shensheng Biotech limited  
96 Co., China), and TV ultra-sonication (Sonix, USA) were used.

#### 97 2.1.2 RP-HPLC method

98 1200 infinity series LC connected to 1260 UV - VIS detector with 1260  
99 infinity, and 15 cm x 4.6 mm (i.d 5 µm particle size) Zobrax SB C<sub>8</sub> column  
100 (Agilent, USA) were used.

#### 101 **2.2. Pure samples:**

102 ACP (99.21%), FLL (99.08%) and ETFP (99.18%) were purchased from  
103 Sigma-Aldrich (Cairo, Egypt).

#### 104 **2.3 Commercial formulations:**

105 - Jinx<sup>®</sup>(ACP; 20 % w/w, Batch No. 309872), Moncut<sup>®</sup> (FLL; 25 % w/w,  
106 Batch No. 206214) and Primo<sup>®</sup> (ETFP; 10 % w/w, Batch No. 2046) were  
107 purchased from producing companies; Claire Manufacturing Co. (USA),  
108 Nichino Inc. (USA) and Shoura Chemicals (Alexandria, Egypt),  
109 respectively.

#### 110 **2.4 Chemicals and reagents:**

111 Methanol and acetonitrile (HPLC grade) were purchased from Sigma-  
112 Aldrich Chemie (GmbH, Germany). Hexane, glacial acetic acid, acetone  
113 and sodium sulfate of analytical grade were purchased from El-Nasr  
114 Pharmaceutical Chemicals Co. (Cairo, Egypt). De-ionized water was  
115 purchased from SEDICO Pharmaceuticals Co. (Giza, Egypt).

#### 116 **2.5 Standard solutions**

117 ACP, FLL and ETFP standard stock solution (1000  $\mu\text{g mL}^{-1}$ ) and standard  
118 working solutions (100 & 10  $\mu\text{g mL}^{-1}$ ) were prepared in methanol.

119 ACP, FLL and ETFP commercial stock solutions (1000  $\mu\text{g mL}^{-1}$ ) and  
120 working solutions (100 & 10  $\mu\text{g mL}^{-1}$ ) were prepared in methanol.

## 121 ***2.6 Field sampling:***

### 122 *2.6.1 Sample preparation:*

123 Tomato samples were collected from El-azab district, Al-Fayoum  
124 Governorate, Egypt during the winter season (average temperature: 20°C).

125 Samples of three kg of previously sprayed ripe tomatoes by the studied  
126 pesticides were collected at three replicates each one was one kg so the  
127 total weight for all the samples was three kg. The samples were taken 1, 3,  
128 7 and 10 days after spraying by pesticides regarding FAO/WHO guidelines  
129 (FAO/WHO. 1985).

### 130 *2.6.2 Sample extraction:*

131 1 Kg of sprayed tomato fruits was peeled then the peels were chopped and  
132 shake with 20 mL of acetonitrile for 2 minutes in a 50 ml centrifuge tube  
133 then 5 g of sodium sulfate were added. The tube was centrifuged for 2  
134 minutes at 6000 rpm. Supernatant extracts were collected, quantitatively,  
135 and concentrated to 3 mL under vacuum using a rotary flash evaporator at  
136 28 °C. All the process of preparation was done thoroughly using clean tools  
137 to prevent cross-contamination. Samples were kept at a fridge to minimize  
138 pesticides losses via evaporation or degradation according to a  
139 recommendation of the European Commission.

## 140 ***2.7 Calibration curves***

### 141 *2.7.1 HP-TLC method*

142 A series of serial dilutions of ACP, FLL, and ETFP in concentrations  
143 ranges from 0.10-1.40, 0.01-0.22 & 0.01-0.20  $\mu\text{g mL}^{-1}$ , respectively, were  
144 prepared. Samples were applied on HP-TLC plates using 10  $\mu\text{L}$  of each  
145 prepared solution using a Camag-Linomat IV applicator.

#### 146 2.7.2 RP-HPLC method

147 Different series of serial dilutions of ACP, FLL, and ETFP in  
148 concentrations ranges from 1.00-14.00, 0.10-2.20 & 0.10-2.00  $\mu\text{g mL}^{-1}$ ,  
149 respectively, were prepared. Triplicate injections were carried out with  
150 injection volume 20  $\mu\text{L}$ .

151

### 152 **3. Results and discussion**

#### 153 ***3.1-Method development and optimization***

##### 154 3.1.1 HP-TLC method

155 Chloroform/acetone, hexane/acetone, methanol /chloroform and  
156 methanol/hexane were tried but give bad separation. The addition of acetic  
157 acid to methanol/ hexane reduces tailing and achieves moderate separation  
158 (Benger, 1991). Finally, the developing system methanol: hexane: acetone:  
159 glacial acetic acid (8: 2: 0.5: 0.1, by volume) gives optimum separation.  $R_f$   
160 values of the concerning pesticides are 0.30, 0.45 and 0.71 for ACP, FLL  
161 and ETFP, respectively, **Figure 1**.

##### 162 3.1.2 RP-HPLC method

163 Multiple chromatographic conditions have manipulated to achieve the best  
164 resolution for the three concerning pesticides including organic modifier,  
165 scanning wavelength of detection and flow rate. Methanol: water (70: 30  
166 and 50: 50, v/v) and methanol: 0.2 % acetic acid solution (80: 20, v/v) give

167 bad separation, then acetonitrile: water (75: 25, v/v) gives moderate  
168 separation with broad peaks, finally acetonitrile: water (75: 25,v/v), pH  
169 adjusted to 2.87 with glacial acetic acid results in the best resolution with  
170 no tailing (Hajimehdipoor, Shekarchi, Hamedani, Abedi, Zahedi, & Gohari,  
171 2011). Scanning at 225 nm gives highly sensitive results with the lowest  
172 LOD and LOQ values. Many flow rates were tried; 0.60 mL min<sup>-1</sup> gives  
173 the best resolution and short time of estimation. The retention time values  
174 are 5.68, 7.50 and 9.01min for ACP, FLL and ETFP respectively, as  
175 illustrated in **Figure 2**. By plotting the concentrations versus the relative  
176 peak areas, a linear relationship has obtained. **Table I** shows the regression  
177 equation parameters.

### 178 **3.2. Method validation**

179 Method validation has carried out for both proposed methods regarding  
180 ICH guidelines (International Conference on Harmonization, 2005).

#### 181 3.2.1 Linearity:

182 A linear relationship has obtained for both methods in concentration range  
183 0.10-1.20, 0.02-0.25, and 0.02-0.20 µg band<sup>-1</sup> for each of ACP, FLL, and  
184 ETFP by HP-TLC, respectively, and 1.00-14.00, 0.10-2.20, and 0.10-2.00  
185 µg mL<sup>-1</sup> for each of ACP, FLL, and ETFP by RP-HPLC, respectively,

#### 186 **Table I.**

#### 187 3.2.2 Accuracy:

188 The recovery % of blind pure pesticide samples have calculated and the  
189 concentration ranges have determined using Beer's law, **Table I**. The  
190 obtained recoveries percent are 99.24, 99.18, and 99.72 for each of ACP,

191 FLL, and ETFP by HP-TLC, respectively, and 99.48, 100.09, and 99.68 for  
192 each of ACP, FLL, and ETFP by RP-HPLC, respectively, **Table II**.

### 193 3.2.3 Precision:

194 It has tested regarding to both repeatability and intermediate precision.  
195 Values verify the precision of the proposed methods showing repeatability  
196 0.486, 0.515, and 0.484 for each of ACP, FLL, and ETFP by HP-TLC,  
197 respectively, and 0.418, 0.427, and 0.395 for each of ACP, FLL, and ETFP  
198 by RP-HPLC, respectively, **Table I**.

### 199 3.2.4 Specificity:

200 **Figures 1 & 2** show peaks of the studied pesticides verifying the specificity  
201 of the proposed HP-TLC and RP-HPLC methods, respectively, without  
202 interference from other excipients.  $R_f$  values of the concerning pesticides  
203 are 0.30, 0.45, and 0.71 for ACP, FLL, and ETFP, respectively. The  
204 retention time ( $t_R$ ) values are 5.68, 7.50, and 9.01min for ACP, FLL, and  
205 ETFP respectively. **Table II** shows the values of R% of each drug  
206 determined by each method.

### 207 3.2.5 Limit of detection (LOD) and Limit of quantitation (LOQ)

208 The limit of detection (LOD) has calculated and found to be 0.030, 0.006,  
209 and 0.006 for each of ACP, FLL, and ETFP by HP-TLC, respectively, and  
210 0.031, 0.030, and 0.031 for each of ACP, FLL, and ETFP by RP-HPLC,  
211 respectively.

212 Limit of quantitation (LOQ) has calculated and found to be 0.090, 0.019,  
213 and 0.018 for each of ACP, FLL, and ETFP by HP-TLC, respectively, and  
214 0.910, 0.092, and 0.093 for each of ACP, FLL, and ETFP by RP-HPLC,  
215 respectively, **Table I**. LOD & LOQ have calculated according to the

216 reference; (Shrivastava and Gupta, 2011;  $LOD=3.3 \times SD$  of the  
217 response/slope,  
218  $LOQ=10 \times SD$  of the response/slope.

### 219 3.2.6 Robustness:

220 Robustness of the methods have verified by deliberate small changes in the  
221 chromatographic conditions (USP, 2011), % RSD of each pesticide has  
222 calculated for both methods; results are listed in **Table SI**.

### 223 3.2.7 System Suitability:

224 **Table III** shows the system suitability testing parameters of the proposed  
225 methods.

### 226 **3.3 Application to commercial formulations**

227 The proposed chromatographic methods have used for the determination of  
228 ACP, FLL and ETFP in Jinx<sup>®</sup> Powder, Moncut<sup>®</sup> and Primo<sup>®</sup>, respectively,  
229 **Table II**.

### 230 **3.4 Field sample estimation**

231 A clean-up, or dilution step may be necessary to reduce matrix  
232 interferences and reduce contamination of the instrument system leading to  
233 an improved selectivity and robustness (European Commission, 2017). The  
234 novel way of sample preparation presented in this work is correlated to  
235 peeling just the exposed surface to sprayed pesticides and only peeled  
236 surfaces proceed in field sampling. That saves time and cost of sample  
237 preparation. Field samples are collected according to WHO/FDA  
238 guidelines.

239 At first day of sampling, the field samples estimation shows values little  
240 over the acceptable values of the maximum residues limits (MRLs) that

241 obey the recommended dose for human health and vegetable productivity  
242 regarding FDA authority (Michael, 2015), (Michael, 2010) and (Michael,  
243 2013). But at tenth day, they shows values much less than that of MRLs,  
244 the results are listed in **Table SII**.

### 245 ***3.5 Statistical estimation***

246 The results obtained by the two developed chromatographic methods for  
247 the estimation of pure samples of ACP, FLL, and ETFP have statistically  
248 compared to those obtained by the reported methods (Lazić, Šunjka,  
249 Grahovac, Guzsvány, Bagi, & Budakov, 2012), (Kikuchi, Sakai, Nemoto,  
250 & Akiyama, 2018), (Sung, Abd El-Aty, Young, Myeong, Mi, & Han,  
251 2014); where no significant differences have found between them, **Table**  
252 **IV**.

### 254 **Conclusion**

255 This work presents two highly specific chromatographic HP-TLC and RP-  
256 HPLC methods. They could determine the concerning pesticide residues in  
257 very low concentrations with perfect accuracy and precision. The novelty  
258 of the proposed methods is hidden in determination specifically the  
259 pesticides which selectively are used effectively on only palatable  
260 tomatoes' parts. The proposed methods, superiorly are more specific, more  
261 economic and need less sophisticated tools and follow simpler extraction  
262 procedures than the published GC-Mass method (Zhao, 2014). Whereas the  
263 publisher uses complicated procedures for sample preparation and using the  
264 whole plant consuming longer time and requiring more expensive  
265 instrumentation. The most advantage of the methods presented in this work

266 over the published ones is their cost-effectiveness and simplicity of  
267 instrumentation making them suit inspection organizations in developing  
268 countries. Thus the proposed chromatographic methods can be used for  
269 monitoring ACP, FLL, and ETFP residues on tomato fruits for inspection  
270 purposes at Health ministry laboratories. Moreover, they could analyze  
271 corresponding commercial formulations without interference from  
272 excipients.

### 273 *Acknowledgment*

274 The senior author is appreciated and gives all thanks to Prof. Assis. Khaled  
275 A. M. Khaled, Faculty of Agriculture, Beni-suef University, for his  
276 generous consultation through writing this work. The authors would like to  
277 express her sincere thanks to the Faculty of Pharmacy, Fayoum University  
278 for its financial support.

## Highlights

460

461

462 • The developed chromatographic methods are highly sensitive  
463 and specific and have more economic methodology.

464 • The proposed field sample extraction procedures follows novel  
465 simple economic steps.

466 • The methods performance are good consistency with the  
467 corresponding GC method and superiorly simpler than it.

468 • The methods can be used for monitoring the pesticides  
469 residues.

470
